DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 15, 32, and 45 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 15, 32, and 45 recite the limitation "said bevel". There is insufficient antecedent basis for this limitation in the claims.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 1725

- 5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 6. Claims 1-6, 8-23, and 25-45 are rejected under 35 U.S.C. 103(a) as being unpatentable over Thorburn et al. (US 4,193,440) in view of Kush (US 5,363,902).

Thorburn et al. disclose a belt-cooling and guiding means for the continuous belt casting of metal strip in a twin belt caster having flexible endless belts, with the apparatus containing an array of removable, hexagonal, and planar guiding and supporting (elongated) nozzle elements facing (adjacent to) and beveled from the reverse surface of the belt, which, in combination with liquid-withdrawal spaces (drainage areas, or gaps), form continuous slots of substantially uniform width between adjacent edges (abstract; column 1, lines 6-17 and 30-55; column 2, lines 1-25 and 44-61; column 3, lines 22-35; column 5, lines 28-46; column 6, lines 39-54; column 10, lines 1-44; and Figures 1-8). The coolant consists of a rapidly flowing layer (continuous uniform liquid film) of pressurized liquid with drainage openings covering less than 10% of the total belt surface, with the guiding face (surface) over which the coolant flows

Art Unit: 1725

capable of moving a small amount angularly in any direction (column 2, lines 16-41; column 4, lines 13-19; column 8, lines 60-68; column 9, lines 1-8; and Figures 5-11). One of ordinary skill in the art would have recognized that the dimensions of the slots and bevels would be adjustable to conform to the spacing between a portion of the belt and each flat peripheral region of the nozzle faces, the depth and angles of concavity in the nozzle faces, and the water pressure (to obtain the fluid velocity), for the purpose of providing an optimum relationship between the belt, the water layer, and the nozzle faces. It would have been obvious to one having ordinary skill in the art at the time the invention was made to optimize the above parameters taught by Thorburn et al., since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA 1980). Thorburn et al. do not specifically disclose a continuous slot in the support surface arranged transversely substantially completely across the casting belt, as well as a vacuum system associated with the drainage opening.

However, Kush discloses a contained quench system for controlled cooling of a twin belt continuous casting machine, in which the apparatus contains a vacuum system in communication with drain pipes, as well as a plurality of webs containing slots that serve as cooling means and supports that are transverse to the casting belt (abstract; column 1, lines 6-10; column 3, lines 65-68; column 4, lines 1-28; column 5, lines 30-68; column 6, lines 1-35; and Figures 1-6). These additional features are advantageous for relieving pressure and containing quenching fluid from longitudinally escaping along the belt surface (column 5, lines 30-68; and column 6, lines 1-35).

Art Unit: 1725

It would have been obvious to one of ordinary skill in the art at the time the applicants' invention was made to modify the belt-cooling and guiding means in the continuous caster of Thorburn et al., by adding the vacuum system in communication with the drain pipes, as well as a plurality of webs containing slots that serve as cooling means and supports that are transverse to the casting belt, as taught by Kush, in order to relieve pressure and to contain quenching fluid from longitudinally escaping along the belt surface (Kush; column 5, lines 30-68; and column 6, lines 1-35).

7. Claims 7 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Thorburn et al. (US 4,193,440) in view of Kush (US 5,363,902) as applied to claims 1 and 18 above, and further in view of Dumont-Fillon et al. (US 3,799,239).

Thorburn et al. (in view of Kush) disclose all the elements of claims 1 and 18 above. Neither Thorburn et al. nor Kush specifically discloses the use of a filter for filtering particles from the cooling liquid.

However, Dumont-Fillon et al. teach a method for continuous casting of metal in which a filter is used for providing fresh coolant and cleaning recirculated spent coolant prior to flow into the supply conduit, which is shown to be conventional in the art, for the purpose of filtering particles that would build up in narrow orifices of each nozzle, which would be detrimental to uniform cooling (column 2, lines 53-67; column 5, lines 57-67; and column 6, lines 1-2).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the belt-cooling and guiding means in the continuous

Art Unit: 1725

caster of Thorburn et al., with the transverse continuous slots and vacuum system taught by Kush, in order to relieve pressure and contain quenching fluid from longitudinally escaping along the belt surface, and further use the filtering means of Dumont-Fillon et al., in order to filter particles that would build up in narrow orifices of each nozzle, which would be detrimental to uniform cooling (Dumont-Fillon et al.; column 2, lines 53-67; column 5, lines 57-67; and column 6, lines 1-2).

Response to Arguments

- 8. The examiner acknowledges the applicants' amendment (paper #7) received by the USPTO on March 5, 2002. The proposed drawing corrections to Figures 6A and 6B are approved by the examiner. The objections to the specification and claims have been overcome by the applicants' amendment. Claims 1-45 are currently pending in the application.
- 9. Applicant's arguments with respect to claims 1-45 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The Yoshida et al. and Wyatt-Mair references are also cited to show related art.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin P. Kerns whose telephone number is (703) 305-3472. The examiner can normally be reached on Monday-Friday from 8:00am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tom Dunn can be reached on (703) 308-3318. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 305-7718 for regular communications and (703) 305-6078 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0661.
